

MTS DuraGlide® 201 Hydraulic Actuators

Precise actuation for testing applications

THE NEED TO TEST FASTER, WITH HIGHER LOADS, GREATER
FIDELITY AND INCREASED UPTIME, HAS PUT TOUGHER DEMANDS
ON ACTUATORS. TO MEET THESE NEW REQUIREMENTS, THE NEXT
GENERATION OF MTS ACTUATION IS LONGER LASTING AND MORE
PRECISE THAN EVER BEFORE.

The Right Actuator

MTS actuators are designed to meet the unique precision and dependability requirements of testing. Our engineers use proprietary materials and processes to minimize friction, helping to maximize reliability, wear resistance and energy efficiency. The MTS DuraGlide 201 Hydraulic Actuator uses the latest technology to create our best single-ended actuator yet.

Improved Data Accuracy

These high-fidelity actuators save time by producing statistically significant results in fewer batches. In a closed-loop system, fidelity is only as good as the weakest link, and a poor performing actuator will add distortion and measurement uncertainty into the system. To maximize performance and produce more accurate results, the MTS DuraGlide 201 actuator incorporates proprietary seal and bearing designs that reduce friction.

Longer Performance Life

The low-friction design uses only 1% of rated load, resulting in smooth operation that reduces wear and extends operating life. The MTS DuraGlide 201 Actuator is also validated through physical testing to more than 100% of rated load, providing dependable performance for longer life. Another way to extend actuator life is to choose the optional SureCoat® Rod Finishing Technology to increase service life by 10x over the previous generation actuator.

More Standard Options

With three standard rod configurations and one of the widest ranges of stroke lengths, it is easy to find the appropriate solution for your test applications. There is no need to compromise on size or features—get exactly what you need. These fatigue-rated, single-ended actuators are ideal for everything from basic testing to high-performance applications.

Difference in the Details

Advanced design characteristics make MTS actuators the preferred choice for hydraulic force generation around the world. With hundreds of standard configurations and optional life-extending features, these actuators can support a full array of test applications.

Piston rod end attachment available with metric or US customary threads. Rod end has spanner wrench holes to aid in fixture attachment.

Single-ended piston rod reduces overall actuator length. Two-piece rod with proprietary fatiguerated joint is available in transducer-ready or solid rod configurations.

Proprietary MTS rod seals provide long life, — low friction and exceptional performance in high-frequency, low displacement applications. Rod seals and bearings can be replaced without breaking the critical cylinder preloaded joint.

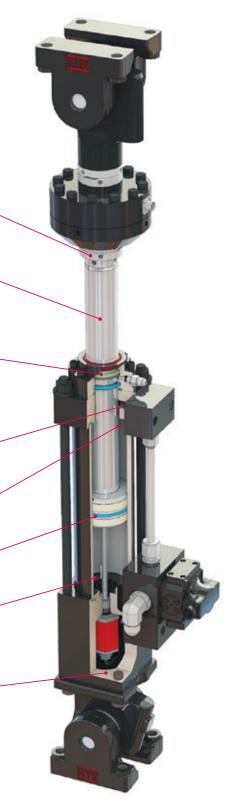

Bearing insert extends actuator life and is field-replaceable.

Ports sized to accommodate approximately 1m/s piston rod velocity, or a servovalve flow rate of up to 340 lpm (90 gpm).

A **reinforced PTFE piston seal** provides a positive seal and reduces friction.

Optional upper and lower hydraulic cushions minimize damage by safeguarding the actuator from accidental high-velocity impacts between the piston and end cap.

Two types of mounting patterns to optimize swivel size to application.

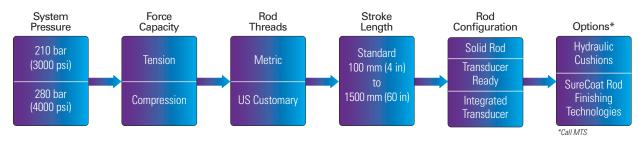

KEY FEATURES

- » Available with or without displacement transducer to meet specific application needs
- » Low-friction seals comprise only 1% of rated load for energy-efficient operation
- » Optional hydraulic cushions to protect the actuator from the effects of high-speed or high-inertial impacts
- » Optional MTS SureCoat Rod Finishing Technology to maximize performance and increase actuator life

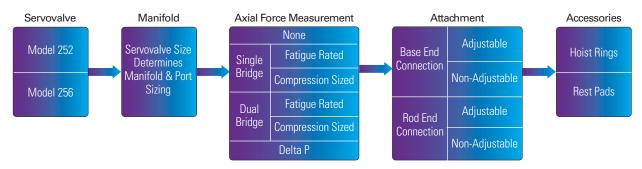

Create Your New Actuator

This step-by-step outline of the configuration process will help you choose the best actuator for your application.

Select a Rod Configuration

The MTS DuraGlide 201 Actuator is available in three standard rod configurations:

- 1. Solid Rod
- 2. Transducer Ready
- 3. Integrated Displacement Transducer

SOLID ROD

This configuration is a good choice when there is no critical need for displacement measurement. This economical actuator simplifies test system setup because there is no need for additional signal conditioning and cabling.

TRANSDUCER READY

This actuator does not come with a displacement transducer, but includes a space within the rod where one can be added. This configuration is a smart choice when there is no immediate need for displacement, but there may be a need in the future.

INTEGRATED DISPLACEMENT TRANSDUCER

This actuator configuration is the best option for performance-critical applications. The integrated Temposonics® displacement transducer is naturally aligned to the center of the stroke, which will produce the most accurate results.

Cylinder Options

Reduce wear and increase actuator life with these finishing options.

HYDRAULIC CUSHIONS

Although hydraulic cushions will protect the actuator piston from direct contact with the end cap, which will extend the life of any actuator, they are most critical in high-velocity applications. Lessening piston impact on the end cap will help maintain the actuator performance for years to come.

MTS SURECOAT ROD FINISHING TECHNOLOGY

MTS SureCoat Rod Finishing Technology increases actuator life expectancy by 10x over actuators with conventionally chrome-plated rods. The rod surface coating and proprietary surface-finishing processes reduce rod banding and unloaded rod chatter as well.

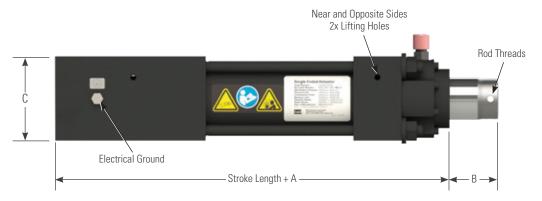

Actuators with MTS SureCoat technology experience less of the distortion that can lead to measurement uncertainty, and they save time by producing statistically significant results in fewer batches and at higher operating frequencies. This technology also helps extend seal life, which improves consistency of testing results and reduces the time needed to complete your test profiles.

^{*}Maximum valve size could result in cylinder damage if a maximum piston velocity end cap strike occurs. Attached mass and piston velocity need to be considered. MTS offers Hydraulic Cushions to help absorb impact energy. Contact MTS for additional information.

^{**}Interfaces with the face seal gland in the manifold with a .75 port.

Durable Components

Choose from a full assortment of complementary products and components for use with your MTS hydraulic actuators. All these options are engineered to improve the quality and repeatability of your test results.

Complete the Assembly

SWIVELS

MTS Series 249 and 249N swivels provide unmatched quality and easy integration with MTS actuator assemblies. The base end swivel includes a cavity to contain a Temposonics* linear-position sensor. This design eliminates the need for a spacer plate, increasing overall stiffness.

Series 249 models feature backlash adjustment, which removes as much relative movement as possible between system and jaws, while allowing the needed rotation for tension-compression loading cycles. Series 249N models do not have backlash adjustment and are ideal for non-reversing applications, such as tension-tension or compression-compression loading cycles.

MOUNTING ACCESSORIES

Choose from a variety of mounting methods, including pedestal, clevis and swivel.

SERVOVALVES

Precision-engineered MTS Series 252 and 256 servovalves deliver high-flow, quick-response and low-distortion performance to uphold the fidelity of your test data.

Other Hydraulic Components

CLOSE-COUPLED ACCUMULATORS

Accumulators provide the stored energy required to meet peak flow demand in a timely manner.

HYDRAULIC SERVICE MANIFOLDS (HSMs)

MTS HSMs reliably control the distribution of hydraulic flow to test stations.

HYDRAULIC POWER UNITS (HPUs)

MTS SilentFlo™ HPUs provide clean, quiet and energy-efficient hydraulic power supply. They are also extremely compact, so they can be deployed directly in the test lab, without the need for special pump housing facilities.

Global Service and Support

MTS fields one of the largest, most experienced global service, support and consulting staff of any testing solution provider. Our complete lifecycle management portfolio can help you maximize your productivity and uptime, while getting the longest functional life possible from your test equipment.

In addition, we can share integration experience to help you create the optimal hydraulic distribution system for your test lab.
